

ReGen Civics Quest Field Guide

Loving Earth, Healing Ourselves

regencivics.earth

What This Quest Is

Creating spaces of deep healing in the Earth. Digging healing holes, composting, working with fungi, building the soil microbiome. The soil is not separate from you.

Story Card

Healthy living soil contains billions of microorganisms per teaspoon — a greater diversity of life than almost any other ecosystem on Earth, besides our own healthy guts. Indigenous cultures understood this. The belief that our health and the health of our land are the same thing was not mysticism. It was ecology, and now science is catching up. When we remove ourselves from the cycle of life, we impoverish both ourselves and the land. This quest asks you to step back in.

How To Do This Quest

Step 1: Find your space.

Identify a patch of ground you have access to and care for. It does not need to be large.

Step 2: Gather fungi.

If you can access old-growth forest, collect a small amount of soil and leaf litter from the base of large, healthy trees. This carries local mycorrhizal fungi.

Step 3: Collect seeds from old trees.

Gather seeds from the oldest, healthiest plants in your local area. Include fruiting plants, nitrogen fixers, and as many of the 7 layers of the forest as you can.

Step 4: Dig your first healing hole.

About 1 ft deep, 3-4 ft wide. This is where your material will go.

Step 5: Feed the hole.

Add a layer of composted organic matter, a layer of forest floor material (to introduce fungi), and your seeds. Cover with soil. Mulch after watering.

Step 6: Tend it.

Return weekly. Notice what grows. Add more material when you dig the next hole nearby. 1 hole per week as your compost fills, each seeded with food plants.

Step 7: Document and share.

Create a short video or article showing your healing space, what you did, and what you are learning.

Deliverable

A 'Showcasing My Healing Whole' video or article documenting your practice.

Tips

- This is a long-term practice. Your submission can document the beginning.
- If you cannot compost humanure yet, a worm bin or regular compost is a valid start.
- Building paths through your space makes it more likely you will spend time there.
